READ THIS NOTICE VERY CAREFULLY

To evaluate your insurability, the Insurer has asked that you provide a sample of your blood, oral fluid taken from your cheek and gum tissue, or urine for testing to determine the presence of human immunodeficiency virus (HIV) antibodies. It may be necessary to provide a sample of more than one of these bodily fluids. A test is considered positive if two ELISA (enzyme-linked immunosorbent assay) blood or other bodily fluid tests are positive, confirmed by the Western Blot blood or other bodily fluid test. These tests may be replaced in the future with new and more effective tests. Other tests which may be performed include blood cholesterol and related lipids (fats) and screening for liver or kidney disorders, diabetes, and immune disorders. These tests are extremely accurate. Further information about HIV testing and AIDS can be obtained by calling the National AIDS Hotline at 1-800-342-2437.

AIDS:

Acquired Immunodeficiency Syndrome (AIDS) is a life-threatening disorder of the immune system, caused by the HIV virus. The virus is transmitted:

- by sexual contact with an infected person
- from an infected mother to her newborn infant
- by exposure to infected blood through shared needles during drug use
- through a blood transfusion

Persons at high risk of contracting AIDS include males who have had sexual contact with another male, drug users who share needles, those whose blood doesn't clot properly, and sexual contacts of any of these persons. In some people, the virus reduces the body's normal defenses against certain diseases or infections. As a result, such people often develop such unusual conditions as severe pneumonia or a rare skin cancer.

The symptoms of AIDS may include the following:

- unexplained weight loss
- persistent night sweats
- cough
- shortness of breath
- diarrhea
 white spi
- white spots evidencing fungal infection
- fever
- swollen lymph nodes lasting more than one month
- raised purple spots on or under the skin or on mucous membranes

AIDS does not typically develop until a person has been infected with HIV for several years. A person may remain symptom free for years after becoming infected. An infected person has a significant chance of developing AIDS over the next 10 years.

PRE-TESTING CONSIDERATIONS

Many public health organizations have suggested that before taking an AIDS-related test, a person seek counseling to become informed concerning the implications of such a test. You may wish to consider counseling, at your expense, prior to being tested.

MEANING OF POSITIVE TEST RESULT

The test is not a test for AIDS. It is a test for antibodies to the HIV virus, which causes AIDS. It shows whether you have been exposed to the virus. A positive test result does not mean that you have AIDS, but that you are at a significantly higher risk of developing problems with your immune system. Persons who are HIV antibody/antigen positive should be considered infected with the AIDS virus and capable of infecting others.

Medical treatment should be sought for the HIV infection and any related infections, as this is a lifelong infection. Responsibility should be taken to prevent knowingly infecting others. Safe sex practices should be performed; drug use with shared needles should be avoided to prevent spread of the infection. The test for HIV antibodies is very sensitive. Errors are rare, but they do occur. Possible errors include:

PART A - (continued)

- 1. False positives The test gives a positive result, even though you are not infected. This happens only rarely and is more common in persons who have not engaged in high risk behaviors. Retesting should be done to help confirm the validity of the positive test.
- 2. False negatives The test gives a negative result, even though you are infected with HIV. This is most likely to happen in recently infected persons; it takes at least 4 to 12 weeks for a positive test result to develop after a person is infected, and may take as long as 6 to 12 months.

Your private physician, a public health clinic, or an AIDS information organization in your city might provide you with further information on the medical implications of a positive test.

Positive HIV antibody test results will negatively affect your application for insurance. This means that your application may be declined, that an increased premium may be charged, or that other policy changes may be necessary.

CONFIDENTIALITY OF TEST RESULTS

All test results are required to be treated confidentially. They will be reported by the laboratory to the Insurer. The test results may be disclosed as required by law or may be disclosed to employees of the Insurer who have the responsibility to make underwriting decisions on behalf of the Insurer or to outside legal counsel who needs such information to effectively represent the Insurer in regard to your application. The results may be disclosed to a reinsurer, if the reinsurer is involved in the underwriting process. The test results may be released to an insurance medical information exchange under procedures that are designed to assure confidentiality, including the use of general codes that also cover results of tests for other diseases or conditions not related to AIDS, or for the preparation of statistical reports that do not disclose the identity of any particular person. The organizations described above may maintain the test results in a file or data bank. Positive HIV and hepatitis antibody/antigen tests will be reported to your State Department of Health if the laboratory or the insurance company are required or permitted to do so by law.

NOTIFICATION OF TEST RESULTS

If your test results are negative, no routine notification will be sent to you. If your test results are reported by the laboratory to the Insurer as being positive, you are entitled to that information if you so desire. Because a trained person should deliver that information so that you can understand clearly what the test results mean, you are asked to list your private physician on the Notice and Consent form so that the Insurer can have him or her tell you the test result and explain its meaning.

PART B - NOTICE AND CONSENT FOR BLOOD OR OTHER BODY FLUIDS AIDS-RELATED TESTING Issued by American National Insurance Company

Read this notice very carefully. Do not sign it unless it is completely filled out and you have read and understood it.

I have received, read, and understand the Notice and Consent For Human Immunodeficiency Virus/AIDS-Related Testing ("Part A"). I voluntarily consent to the collection/withdrawal of blood, oral fluid from cheek and gum tissue, or urine from me, the testing of that sample, and the disclosure of the test results as described in Part A. I have read and understand the information provided to me about what a positive test result means and understand that I should contact a local AIDS service group or my private physician for further information and counseling if the test result is positive.

I understand that I have the right to request and receive a copy of this authorization. A photocopy or facsimile of this form will be as valid as the original.
